

IOWA

Data Visualization

WaterSoftHack '24

Objectives

- Understand the process of visualization and its importance in earth sciences
- Understanding visualization principles
- Getting exposed to visualization tools
- Creative interactive and impactful visualizations
- Dive deeper into the projects

Tools and Libraries

Web-Based Libraries for Data Analysis

- HydroLang.js, HydroCompute, HydroRTC, D3
- Python for data manipulation and analysis

Tools for Development

- VSCode
- Online Resource (Stackblitz for JS)
- Google Colab (Python)

Links for development

Tutorial links (JS):

HydroLang: <https://hydroinformatics.uiowa.edu/tutorials/hydrolang/>

HydroRTC: <https://hydroinformatics.uiowa.edu/tutorials/hydrortc/>

HydroCompute: <https://hydroinformatics.uiowa.edu/tutorials/hydrocompute/>

Other links (JS and Python)

Google Earth Engine: <https://earthengine.google.com/>

Google Colab (Python) : <https://colab.research.google.com/>

Colab Examples (Python):

Part 1 - Introduction

Introduction

Data visualization is the graphical representation of information and data

Many types, largely dependent on your **audience**

- **Process or Method:** flow chart, diagram, infographic, gantt chart, illustration, timeline
- **Compare, Contrast, or Show Change:** bar, line, box and whiskers, bubble, stacked area, pie
- **Establish a Relationship:** networks, heatmaps, maps, radar, mosaic, venn

Importance in Hydrology

- **Enhance understanding** by simplifying complex data and identifying trends, patterns, and anomalies
- **Effective communication** by facilitating findings of diverse audiences including scientists, policymakers, and the public
- **Better decision-making**, supporting data-

Part 2 - Types of Data Visualizations

Common Types

- **Line Charts:** best for showing trends over time (timeseries, relationships between variables)
- **Bar Charts:** great for comparison of quantities across categories (hyetographs)
- **Pie Charts:** Useful for showing proportions
- **Heat Maps:** effective for displaying data density and intensity
- **Scatter Plots:** good for showing relationships between variables
- **Histograms:** used for frequency distributions
- **Maps:** underlying map of a location showing a visualization of interest

Part 3 - Principles of Effective Data Visualization

Best Approaches

Clarity: ensuring that visualizations are easy to understand

- Use clear labels, legends, and titles
- Avoid clutter and excessive detail, less is more!

Best Approaches

Accuracy: represent information truthfully and precisely

- Maintain proportional scales
- Avoid misleading representations and distortions

Best Approaches

Simplicity: keep designs straightforward and focused

- Use minimalistic design elements
- Highlight the most important information

Best Approaches

Aesthetics: make visualizations appealing

- Choosing an appropriate color scheme
- Balance visual elements to enhance readability

Maps and Layers

Good Practices

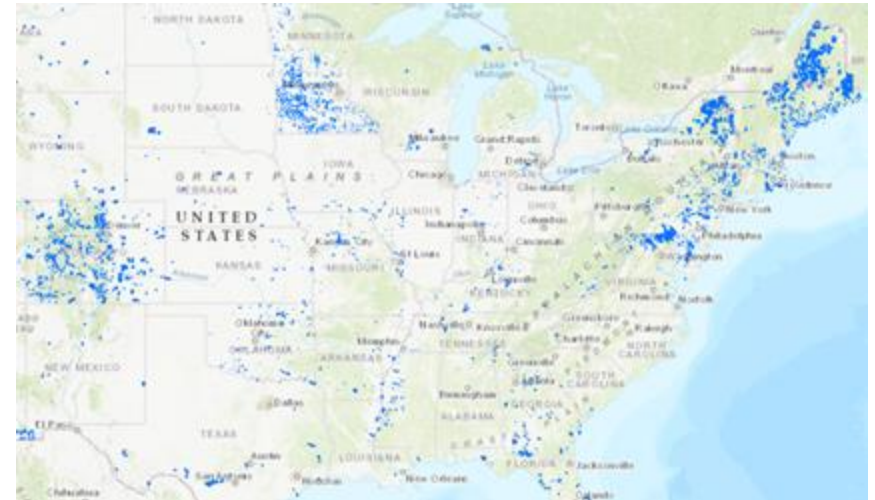

- Easy to read with clear labels and minimal clutter
- Truthful representation with correct scales and proportions
- Focus on the essential information
- Readable text and symbols with good contrast

Bad Practices

- Cluttered with excessive data
- Misleading
- Missing legends or explanations
- Varying styles throughout

The above map depicts conservation easements in the United States as of 2018

Choosing the Right Visualization Type

Always try to match the data you have with the message you want to convey

Examples

- Line charts for trends
- Bar charts for comparisons
- Heat maps for spatial data/correlations
- Clearly state labels and layers in your maps, make the best out of the clutter!

Part 4 - Tools for Data Visualization

Overview of Available Tools and Libraries

JavaScript

- **HydroLang:** create maps and charts through the API, powered by google charts, google maps, leaflet
- **D3:** flexible and powerful library for interactive and dynamic data visualizations
- **Plotly:** Easy-to-Use for interactive charts and dashboards

Python

- **Matplotlib:** standard library used for chart generation
- **Seaborn:** great for creating heatmaps and relational visuals
- **Bokeh:** for creating interactive visualizations

Overview of Available Tools and Libraries

GIS Tools

- **ArcGIS:** need license
- **QGIS:** free and open source
- **Python** using GDAL/OGR

Online Resources

- **Google Earth Engine:** javascript-based containing multiple options for data visualization and manipulation
- **OpenLayers:** high performance engine for the rendering GIS on the web

Part 6 - Advanced Visualization Techniques

Importance

We can now have interactivity through web applications to get better and faster insights on our visualizations

Examples

- **Interactive Charts** enhancing user engagement and data exploration
- **Maps** to visually explore spatial data
- **Dashboards** the combination of multiple comprehensive data analysis

Examples

Data visualization dashboard for streamflow forecasting

<https://hydroinformatics.uiowa.edu/lab/hydrosuite/hydrocompute/cs2/>

Weather Dashboards

<https://www.arcgis.com/apps/dashboards/737e5317ef7343feb3b859f7757682e0>

IFIS

<https://ifis.iowafloodcenter.org/ifis/app/>

USGS National Weather Dashboard

<https://dashboard.waterdata.usgs.gov/app/nwd/en/>

Best Practices for User Dashboards

To Consider

- Always have a **User-Centered** design
- **Simplicity and Clarity** wins the race
- **Consistency** is key for wide adoption
- Utilize the best tools for **Performance**
- Enable **Interactivity** across your tool

Try to get feedback in your design!

Part 6 - Example Case Studies

Visualizing a shapefile on the web

Steps

- Convert the shapefile to geoJSON object
- Load it into a map engine (Leaflet, Google Maps, D3)
- Attach the layer into a visualization object

<https://stackblitz.com/edit/vitejs-vite-njnuhu?file=index.html>
